

Coronavirus Tracker Script

COVID-19 App Demo HTML/JS Example

Edit "[index.html](#)" that came with this documentation and follow instructions to personalize it to your needs, ask technical questions from the [community](#) and [developers](#).

What is it for?

The Coronavirus Tracker Script tracks COVID-19 cases and related data from around the world.

What data is available?

Data is available for countries that are submitting confirmed cases and related COVID-19 records. See full list of [supported countries](#) or list latest data with [Coronavirus API](#).

Live Data: daily (*updated live*): *Total Cases, Active Cases, Recovered, Deaths, Tested, Critical Condition, Change Ratio %s and Summaries.*

Is historical data available?

Historical data includes: *Day, Week, Month, Year, Changes per Day, Differences and Summaries.*

What regions are covered?

World, Countries and reported Regions.

Are U.S. states included?

Yes, you can track all *U.S. States* separately.

Customizing

Selecting country: the script is delivered with a set of 50 countries, randomly selected to display COVID-19 cases data.

Find `var countryFeedKey` and change it to `var countryFeedKey = 'usa';` —replace 'usa' with the country of your choice— [see full list here](#).

Showing multiple countries: duplicate [index.html](#) and name it e.g. "usa.html". Edit and change `var countryFeedKey = 'usa';`.

Adding more data: if you need to display more data like “Tests Made” or “In Severe Condition”, simply add a new section and set the `data-country-placeholder` according to your needs, example:

```
<strong data-country-placeholder="tested">0</strong>
```

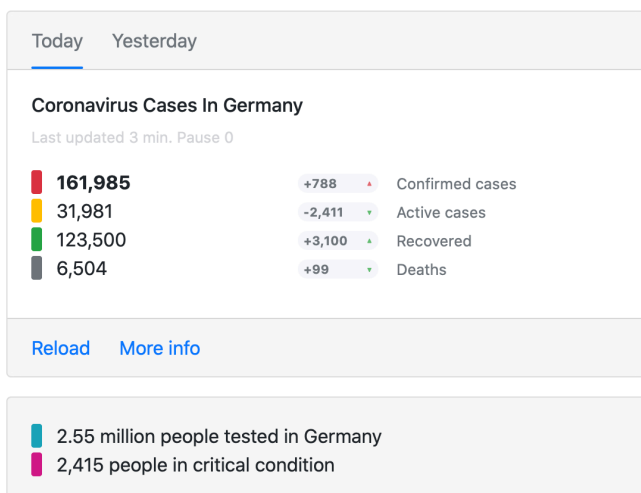

- ask the [community](#) for options for details that you are trying to add
- if you need to display a calculation or present another detail, ask the [community](#), ask technical questions, be specific, to the point
- another place to [ask developers](#)

Coronavirus Charts: Google Charts was used in the attached [covid-19 tracker script](#) however, you may chose any other charting library. We recommend [Chart.js](#), as used on the [Coronavirus Dashboard](#). See examples: [Australia](#), [China](#), [Germany](#), [Mexico](#), [Spain](#), [Thailand](#), [USA](#), [etc](#).

• Find:

```
var chart = new google.visualization.PieChart(document.getElementById('drawchart'));
```

- and change to BarChart, ColumnChart or any other [chart type](#) you may need.
- **Further editing Charts:** ask the community any changes you might need, be specific and to the point: [Coronavirus-Dashboard](#)

OTHER RESOURCES

- Ask the community [Coronavirus-Dashboard/issues](#)
- [Ask other technical details](#) if the community could not help
- Check the [Coronavirus API](#) for more advanced features
- See some great examples at [quarantine.country](#)
- **Add your own tracker to the TOP list**, mention your URL with hashtag **#covidTop** at [coronavirus-dashboard community](#)
